EDUCATION

Bachelor of Science, The University of Texas at Arlington

Expected Graduation: May 2023

Major: Computer Science Engineering

Years: 2019-2022

- Recipient of Maverick Academic Scholarship

Relevant Coursework

Cloud Computing, Human Computer Interaction, Artificial Intelligence, Fundamentals of Machine Learning, Computer Graphics, Computer Networks, Algorithms and Data Structures, Operating Systems

TECHNICAL SUMMARY

Programming Languages: Proficient: Python, C, C++, **Intermediate:** Javascript, SQL, **Basic:** NodeJS, AngularJS, OpenCV, HTML

Tools/Software: Jupyter, Git, Linux Operating System, PrestoDB, MongoDB, IoT, Wearable Technology, React Native, Numpy, Pandas, Spark

Cloud Technologies: Google Cloud Platform, Docker, Kubernetes

Soft Skills: Conflict Resolution, Negotiation, Logical Reasoning

PROFESSIONAL EXPERIENCES

Data Center Engineer Intern at Meta (formerly known as Facebook)

2022

- Worked with the Production Operations Team that is responsible with the upkeep, utilization, and reliability of Meta's server fleet health that serves traffic across roughly 3.6 billion users.
- Analyzed large amounts of data and queried to find most effective functionalities to create and add to existing tools.
- Created core functionalities to an existing automation project that helped improve testing and validation of several internal tools and break fix mechanisms and improved efficiency of the production engineers across the data center.
- Utilized Python, SQL, PrestoDB, Linux, OS knowledge

Software Development Intern at Logituit

2021

- Developed an OTT analytics dashboard for collecting information on user experience using various OTT platforms
- Utilized RESTful APIs for backend API creations and used AngularJS for frontend UI development for the dashboard and was able to analyze user feedback and data on the server side
- Utilized NodeJS, MongoDB and Angular

Regional-Finalist at the Schneider Go Green 2021 Challenge (North America)

2021

- Worked in collaboration with Schneider and AVEVA on improving workforce efficiency and productivity within the industry
- Semi-finalist from 25,000 worldwide students to create a solution to increase the production and energy efficiency and asset lifecycles for the Plants of the Future (Factories)
- Created "SWIFT – Smart Workforce Interface for the Workforce of Tomorrow", aimed at bringing back the retired workforce and introduced digital training for the incoming workforce while also creating a global green impact

Undergraduate Researcher at The Hybrid Atelier (Human Computer Interaction Lab)

2020-present

- Worked on a Bio Signal Processing Project- Utilizing the EmotiBit which is an emotion-sensing wearable technology, application of Python to analyze tacit processes and makes user experience more comfortable.
- Worked on an OpenCV project that involves segmentation of glass pieces, conversion of raster to vector paths, solving view matrix and comparison against reference vector path.
- Currently working on developing an interview chatbot by leveraging Natural Language Processing techniques.

Software Designer at the Infosys Summer of Ideas Challenge

2020

- Selected as one of the 2000 participants nationwide for an 8-week program to create an innovative solution to increase safety in the chemical industry by leveraging Internet of Things (IoT)
- Developed "The AnMoL Ecosystem", aimed to increase safety and security in the Industrial sector in a multitude of ways.

TECHNICAL PROJECTS

The Battles Within:

- Developed a miniature game application on the Unity Engine with C# that portrayed growing issues around mental health. Application had various levels, different game modes, statistics showing the players' performance and a dictionary page with possible upgrades and the characters' details.

Posterior & Prior Probability, Bayesian Networks:

- Created an interactive CLI program in Python to determine and predict probabilities for different hypothesis when provided with a specific set of observations. Also utilized a Bayesian network to generate different combinations and probability distributions.

Routing Network Packets

- Created an interactive command Line GUI written in Python to calculate the distance vector routing protocol using the Bellman-Ford algorithm.

Pokédex

- Created an interactive Geographic Information System on AWS using Javascript, HTML, CSS and jQuery to simulate a Pokédex gaming environment. Utilized Google APIs and the RESTful Pokémon API to extract exact locations of pokémons in the simulation.

AirMon

- Developed a Cloud-Based IoT system to monitor Air Quality Index. The hardware elements utilized were the Arduino UNO WiFi, PMS 5003 Air sensors and the NEO-6M GPS Sensors. Utilized ThingSpeak (IoT data visualization program) software to graph and analyze collected data.

ACHIEVEMENTS

Secured 1st position at WeTech Regional Pitch, Bangalore, India

Global Finalist at WeTech World Pitch, San Francisco, USA

LEADERSHIP & VOLUNTEERING EXPERIENCES

Peer Academic Leader – Division of Student Success

2022-present

College of Engineering Senator, UT Arlington Student Government – Professional Leadership Organization

2020-2022

Social Media Head, Maverick Malayalees - Cultural Organization

2021-2022
